Submitted on 11 Apr 2019

HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Implementing INSPIRE: the BRGM road trip

Mickaël Beaufils, Sylvain Grellet

BRGM in one slide

- > French Geological Survey
- > 1000 people in 5 main départements: water, georessources, natural risks assessment, laboratories & IT
- > An active contributor for interoperability in the geosciences

Main use case: understanding the subsurface

Legend: Features Observations

Real world

Modeled world

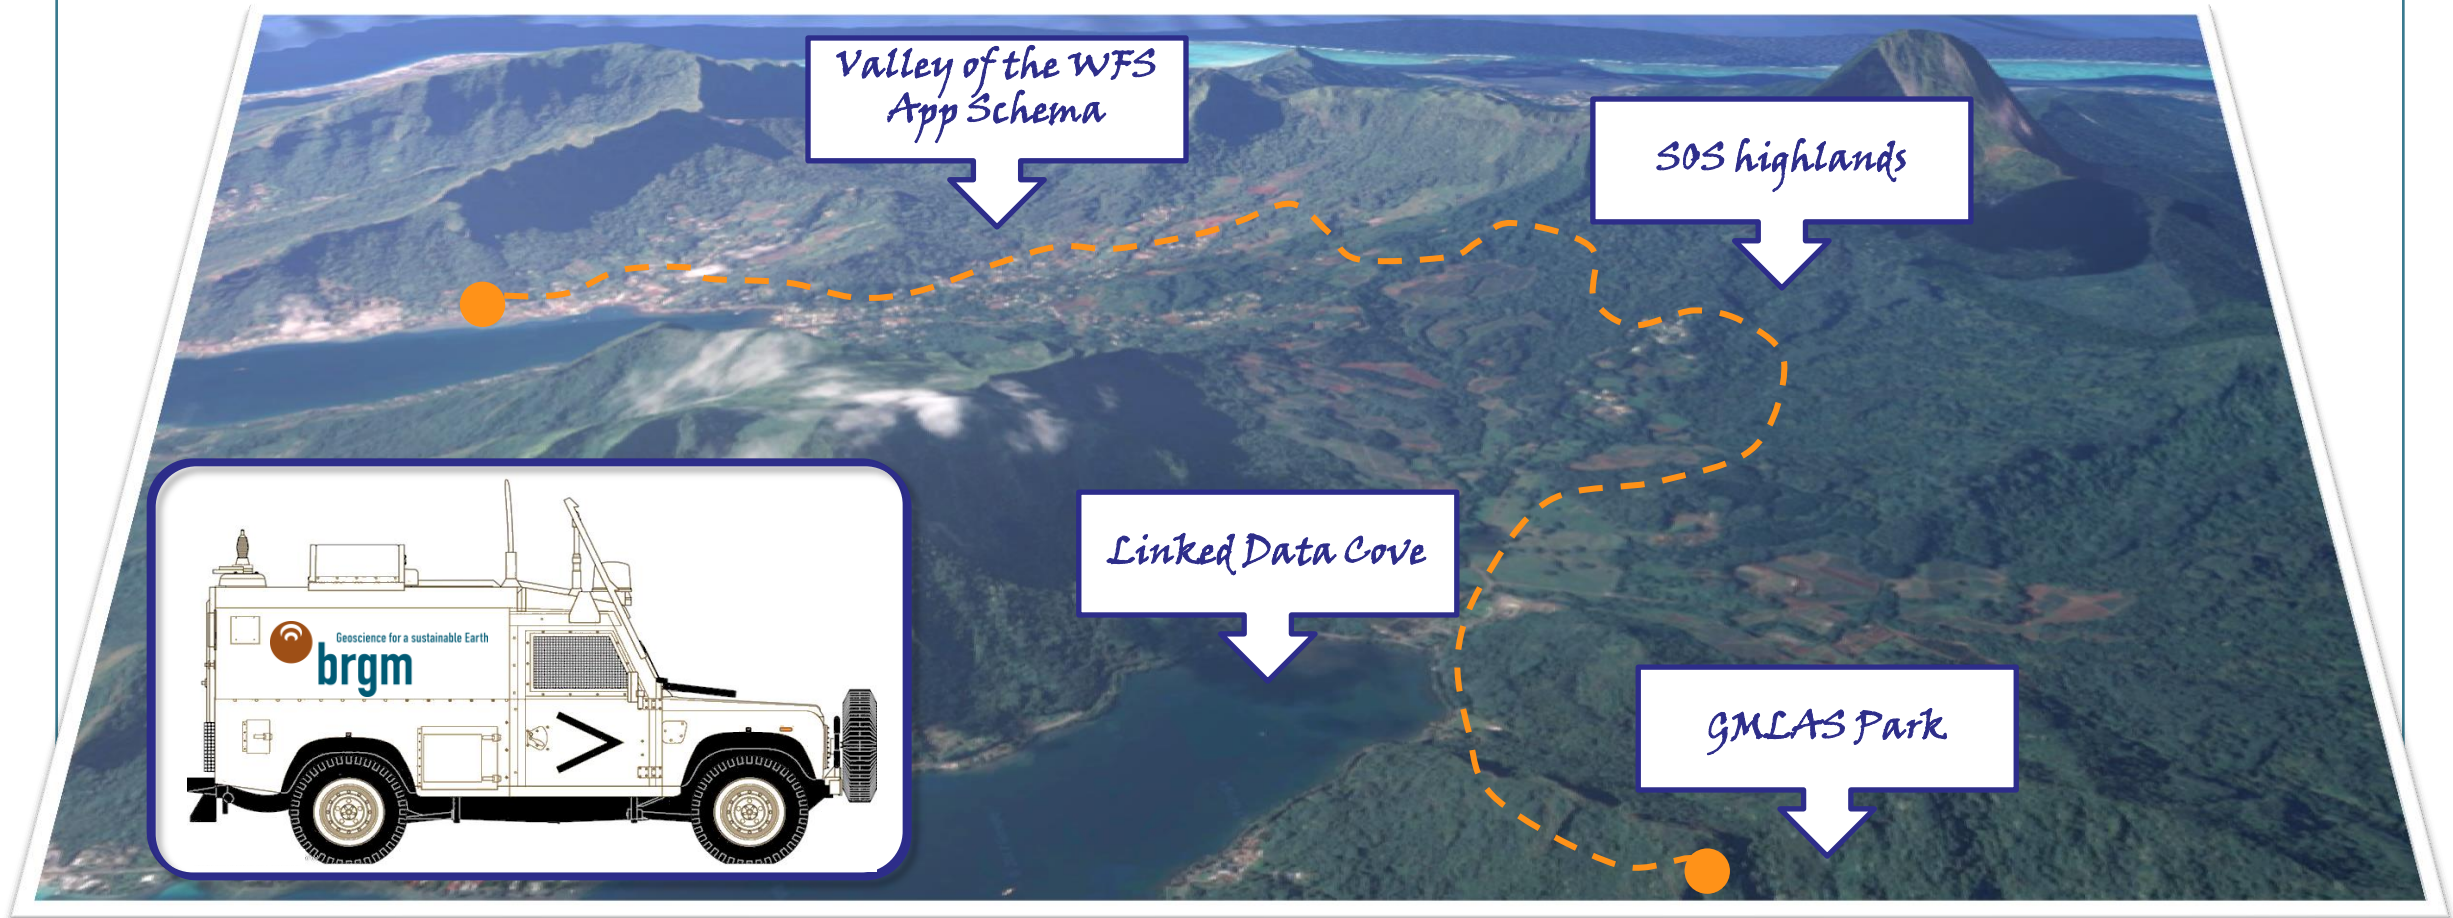

An Information System to fulfill that use case

- > Serving data through interoperable web services (in conformance with INSPIRE)
- > Linking data through derefferencable persistent identifiers
- > Providing tools to work with those data

Roadmap of the trip

WFS App Schema to provide features

> Implementation

- Decision to use GeoServer and its AppSchema extension and to contribute to its enhancement

> Feedback

- AppSchema configuration is tricky
 - Diffusion of « HowTo » for Borehole abstract description in EPOS-IP H2020 Project
- GetFeatureByID is OK
 - But what is needed is a GetFeatureByIdentifier
- GetFeatures with filters is not satisfying
 - Very long response time (when not crashing)
- Performance issues
 - with on the fly mapping (eg. CONCAT)
 - Workaround: specific tables are set for WFS AppSchema (however this is data duplication)
 - when serving millions of instances
 - Workaround: currently planning to finance a connection to SolR index

SOS to provide O&M

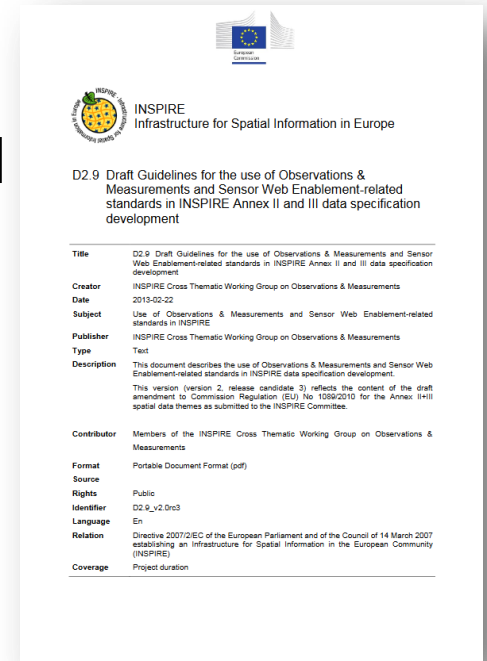

> BRGM is editor of « D2.9 Guidelines for the uses of O&M + SWE in INSPIRE »

> Implementation

- Based on 52°North solution (with specific developments)
- One webapp is deployed per observation property (groundwater levels, geologic logs, ...)

> Feedback

- 52°North solution has its own database schema
 - Data duplication from raw data base (yet MaterializedViews)
- User feedback: Limitations with filters
 - Filter on result is not yet possible according of OGC specs (eg. GetBoreholeLogs that cross that lithology)
- Reusing the REST API and JSON encoding for lot of applications

Identifiers and Linked Data

> Rationale

- Persistent identifiers on observation and domain features are the glue in an interoperable system
- Core idea is to put a URI as a first class element instead of the OGC getFeature/getObservation request

<http://ressource.brgm-rec.fr/obs/RawEarthMaterialLog/BSS001REWW>

Rewrite in proxy mode

<http://192.168.6.208/52n-sos-raw-geologiclogs/service?service=SOS&version=2.0.0&request=GetObservationById&observedproperty=earthmaterial&observation=http://ressource.brgm-rec.fr/obs/RawEarthMaterialLog/BSS001REWW>

- This is too often overlooked in INSPIRE discussions (should resolve vs shall) !

> Implementation

- Apache mod_rewrite : to « translate » the URI in the OGC service requests

BRGM data services (v2017)

Legend:

 Features

 Observation(s)

GML Application Schema suite

> Funded by BRGM and European Environment Agency (Copernicus)

> GMLAS: the converter

- As part of GDAL
- Offer converting functionalities developed to handle Complex Features
- (e.g. Convert GML App Schema files in PostGIS and SQLite format)

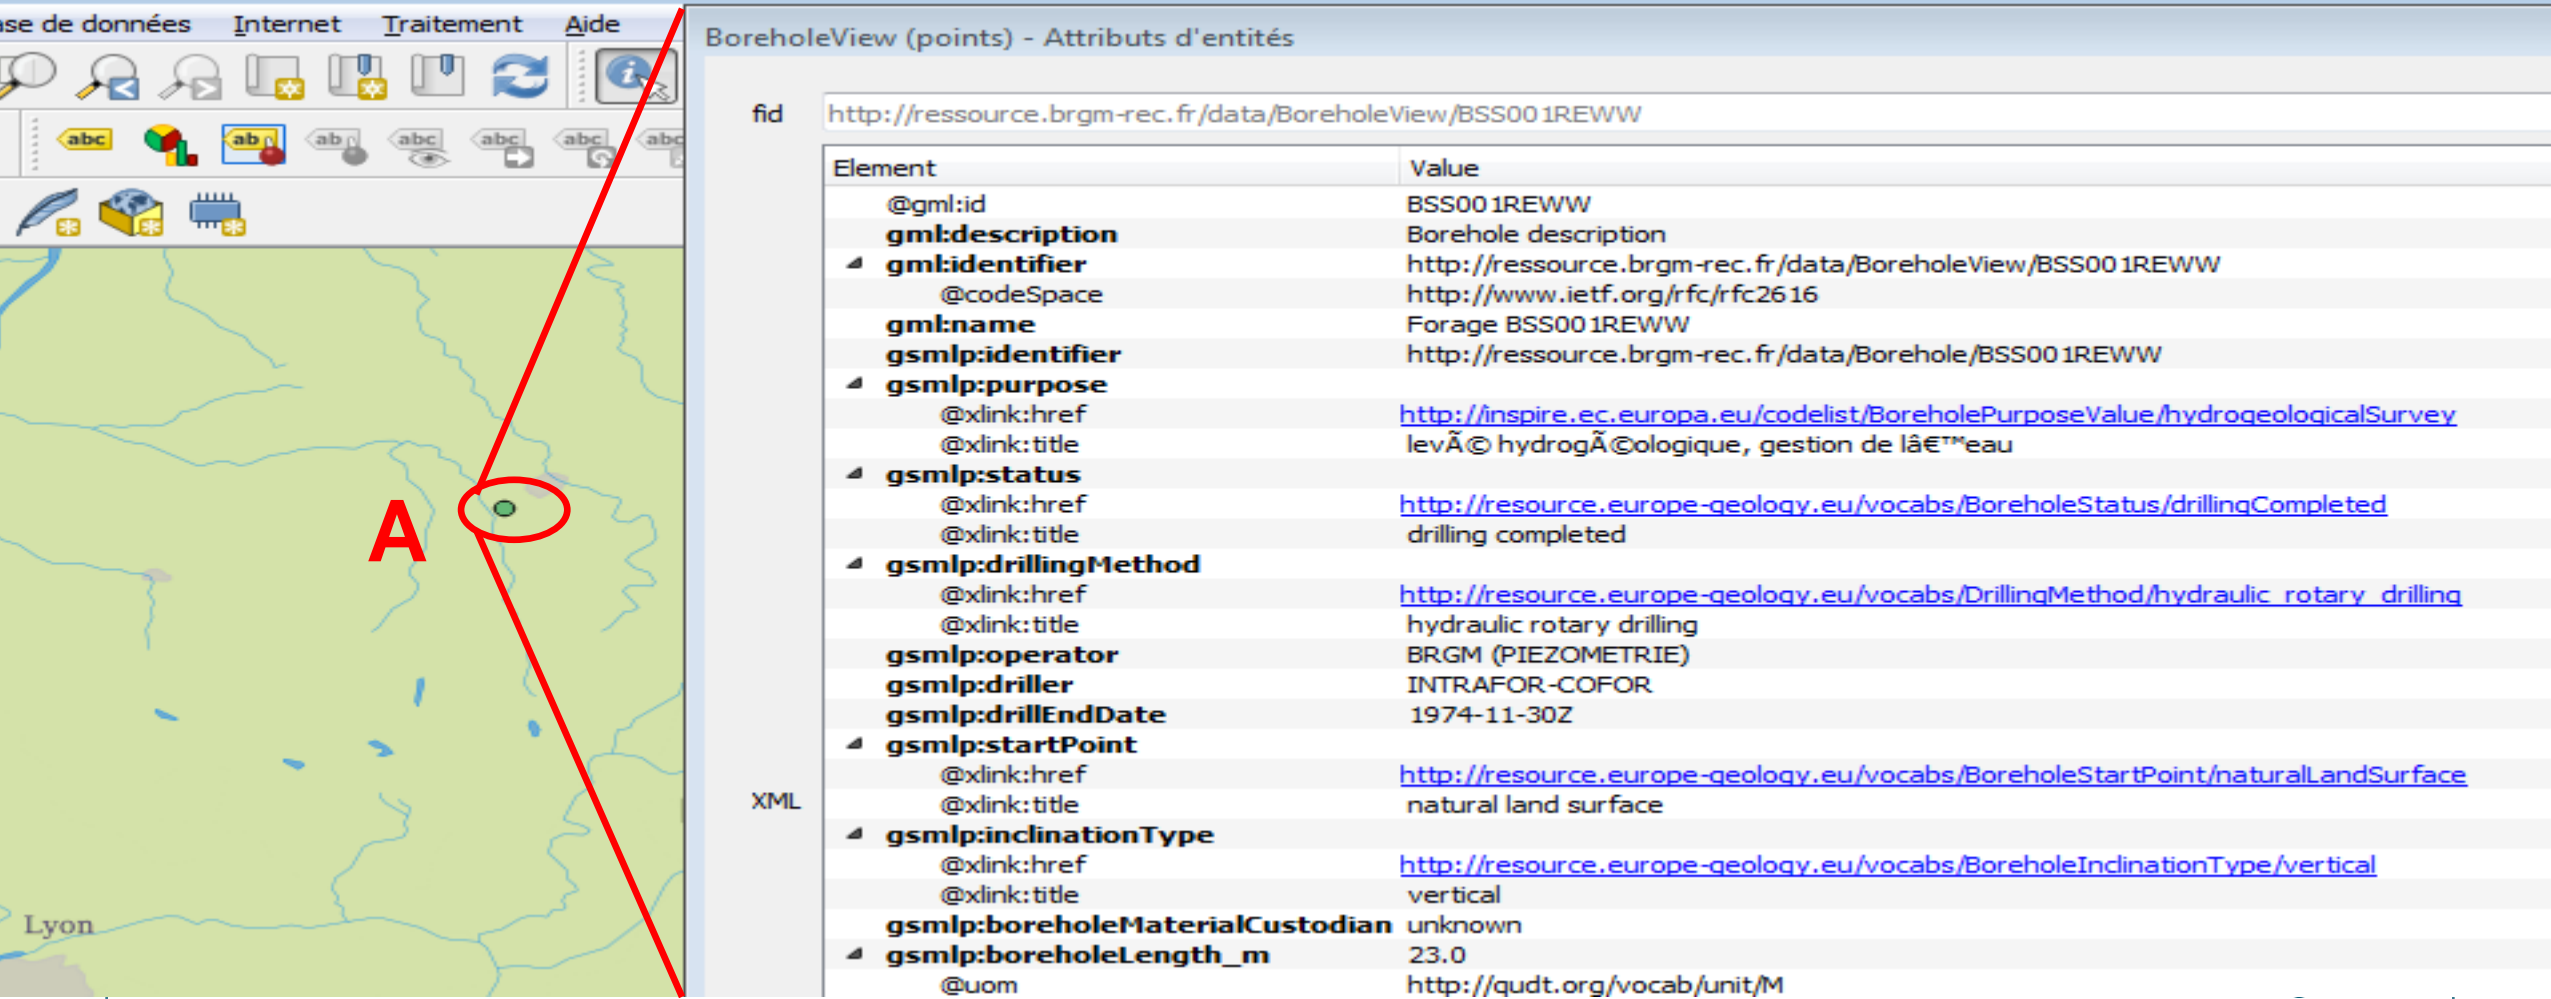

> GMLAS Toolbox: the client

- A plugin for QGIS
- Available for testing through OSGEO4W (AdvancedInstall/qgis-dev 2.99)
- Github : https://github.com/BRGM/gml_application_schema_toolbox

QGIS GML Application Schema Toolbox

Borehole

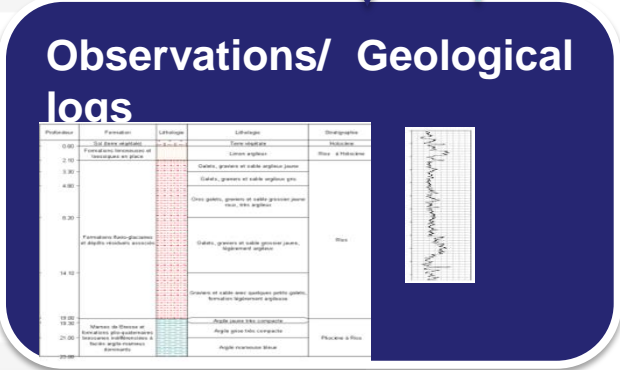

The screenshot displays the QGIS interface. On the left, a map of Lyon is shown with a red circle and the letter 'A' highlighting a specific point. A red line connects this point to the 'BoreholeView (points) - Attributs d'entités' panel on the right. This panel shows the GML schema attributes for the selected feature, including the fid, element names, and their corresponding values.

BRGM perspectives

- > Continue implementing more and more feature types with the current solutions we identified
 - CSW with GeoNetwork
 - WMS with MapServer
 - WFS AppSchema with GeoServer
 - SOS with 52°North solution

- > Yet, continue exploring new horizons and contribute in (financing) technologies improvements
 - GMLAS toolbox still being developed
 - GeoServer connection to solR index to handle huge volumes of data
 - Pub/Sub to notify users of updates in the system
 - SensorThings approach to facilitate sensor data integration

Conclusion

> Building an information system is not a one-time process

- Labs help testing things and get feedback from users
- Users participates in building the system, then it helps getting their support

> Technologies need improvements

- Yet a lot of things have been already done
- Technology providers are willing to help, but we have to feed their efforts (providing use cases, feedback and finance developments)

> We have common needs. Why don't we build a common solution?

- In order to share the efforts. Make things going faster.

GeoScience DWG

- > A Domain Working Group especially dedicated to push GeoScience data interoperability

- > First meeting next week in Southampton OGC TC
 - Thursday 14, 8AM-12AM (UK local time)
 - Discussion and action for:
 - Borehole description
 - 3d geological modelling
 - Urban geology and geotechnics

- > Join us!

Thanks for your attention

m.beaufils@brgm.fr
