PUTTING ALL THIS TOGETHER IN A PROJECT

Sylvain Grellet – BRGM
ENSG – mastère GDM – 2023-01-20

Interoperable / FAIR data in a project – How ?

What not to do

- Consider the “Data” Portal / GUI (@fr ‘IHM’) of a project to be the only target

A GUI

Interoperable APIs

Interoperable Semantics

Data Architecture

System Architecture

Disclaimer : not willing to standardize scientists brains, rather give them time for their real work

Interoperable / FAIR data in a project – How ?

What to do

- Have a holistic approach, taking all the facets of the iceberg into consideration

The FAIR ecosystem

Relies on 3 core elements

Semantic and technical
interoperability standards
/ best practices

Open-source
implementations

International domains
communities building
on FAIR

The FAIR ecosystem

Relies on 3 core elements linked altogether by a virtuous cycle

Semantic and technical
interoperability standards
/ best practices

Open-source
implementations

International domains
communities building
on FAIR

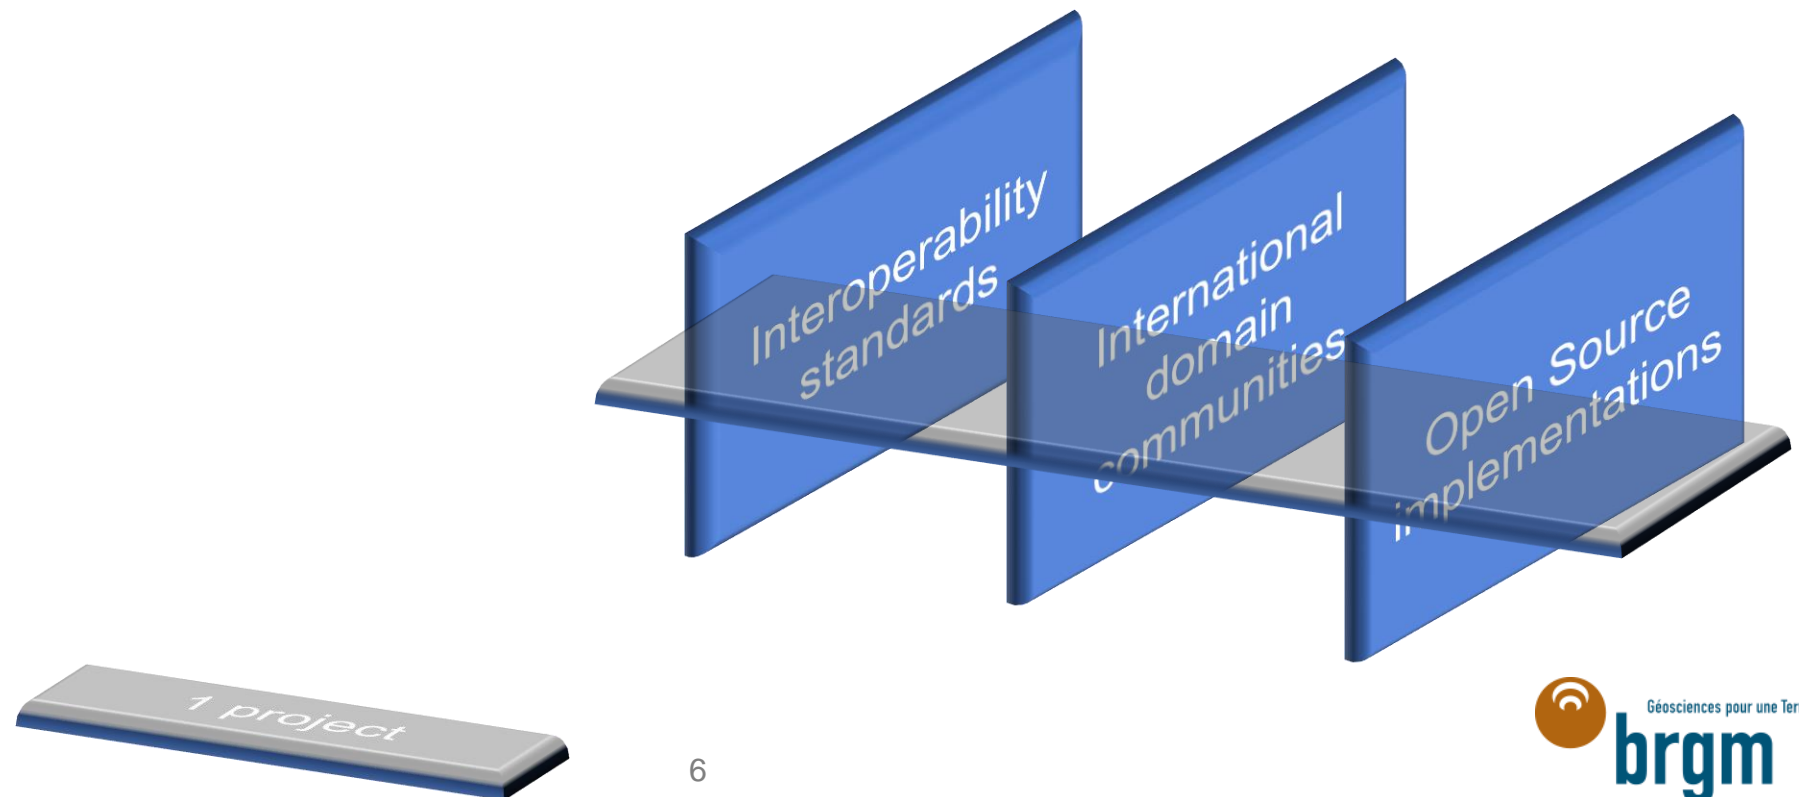

Interoperable / FAIR data in a project – How ?

The challenge is to have that ecosystem implemented in the project

- It shall be the DNA of every project to build on it
 - And not add / shoehorn interoperability / FAIR principles at the end to expose content. Interoperability principles are not only for exposing data to the outside. They are crucial within the system itself.

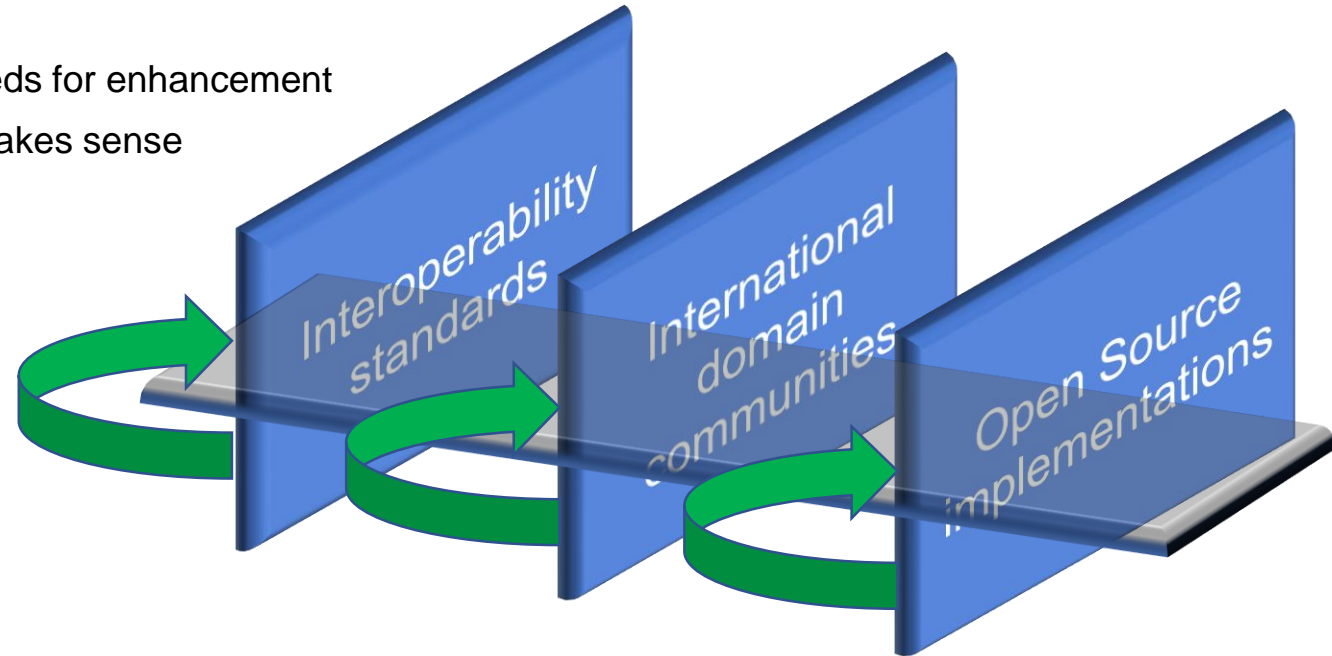

Interoperable / FAIR data in a project – How ?

and make the project implementation part of the ecosystem

- If the project meets limitations / needs for enhancement
 - It feedbacks to the group that makes sense

- Examples:
 - OGC API for Observations (OGC SensorThings API) test : CSV was not part of the output formats. BRGM worked with Fraunhofer / DataCove to specify it. Now it's part of an extension and also one of the reference implementation.
 - BRGM in Observations & Measurements -> Change Requests -> Co-Lead of the OGC/ISO standard revision -> many systems ask us for Guidelines on how to implement it
- Positive “side effect”
 - Contributions to those core elements are visible : this also lead to publications or visible contributions to the communities. It also help those doing core IT work in the tools to have their contribution visible.

Disclaimer : not willing to standardize scientists brains, rather give them time for their real work

Integration in a project

Work sequence

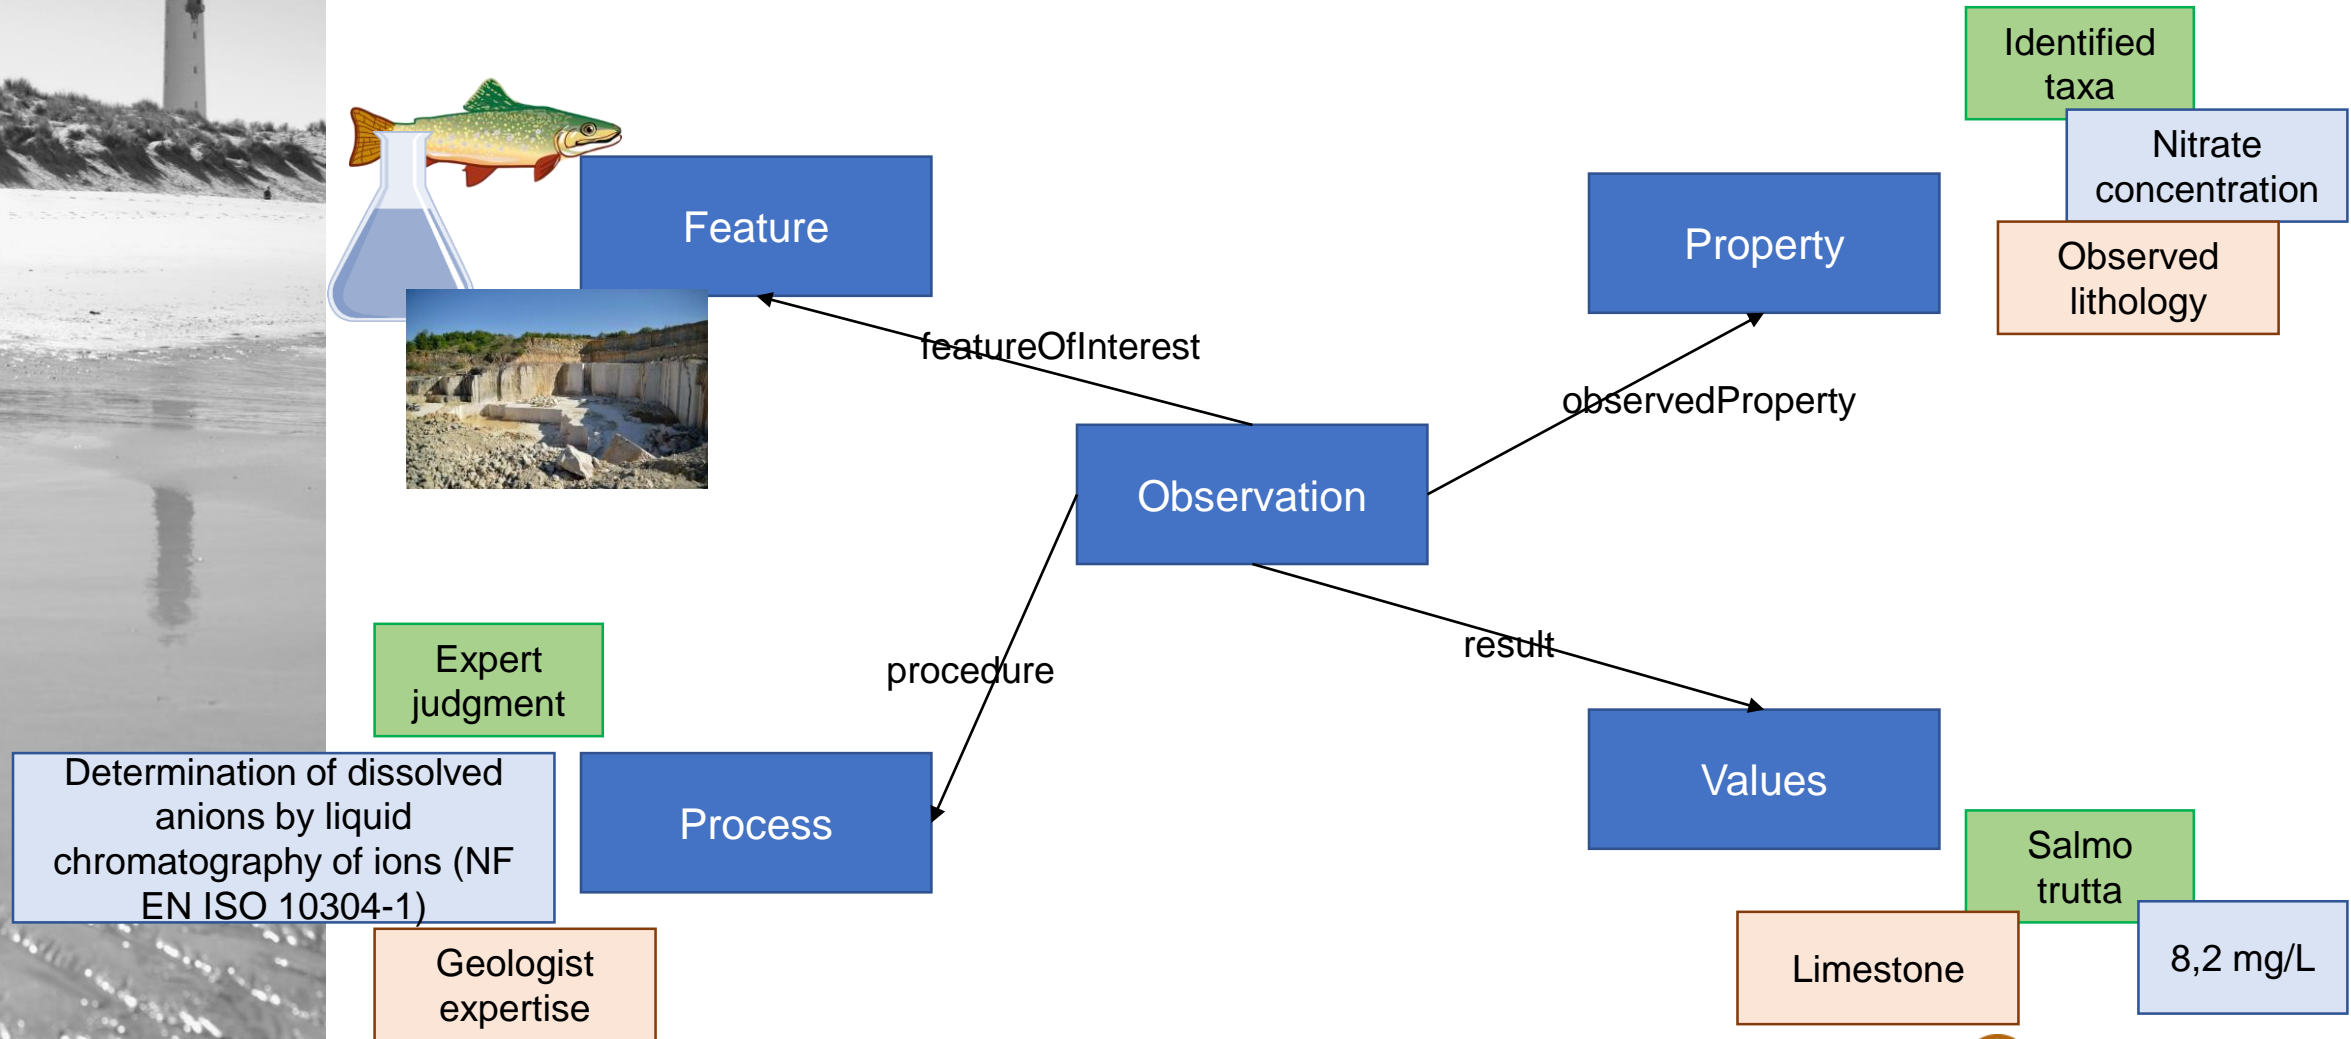

- 0°/ Use Case
 - IT 101, Best Practices => no Use Case, no project ☺
- 1°/ clarify data considerations with domain experts
 - Semantics, provider, transformations etc...
 - Don't only follow the GUI mermaids
 - UX/UI limited to GUI is nice but only looking at this leads to forgetting data semantics. Good data semantics & semiology leads to a better UX/UI.
- 2°/ identify which API to ingest/expose what
 - Knowing what data the projects handles and what are the expected UseCase will help identify the API
- GUI
 - Could work alongside the others, provided a proper feedback loop exists with steps 1 and 2

Some examples

- Generic Observations & Measurements (OM) example : Environmental observation use case
- OM with domain model (river) : OMS level 1 example : surface water quantity (height gage)
- OM with domain model (river) + looooot of related observations : OMS level 2 example : surface water quality (samples)
- EPOS : Multi-standards integration in an Enterprise Architect project

Environmental observation use case - overview

The reference point : Observations & Measurements (O&M)

Environmental observation use case - overview

RESTful API implementing O&M : SensorThings API

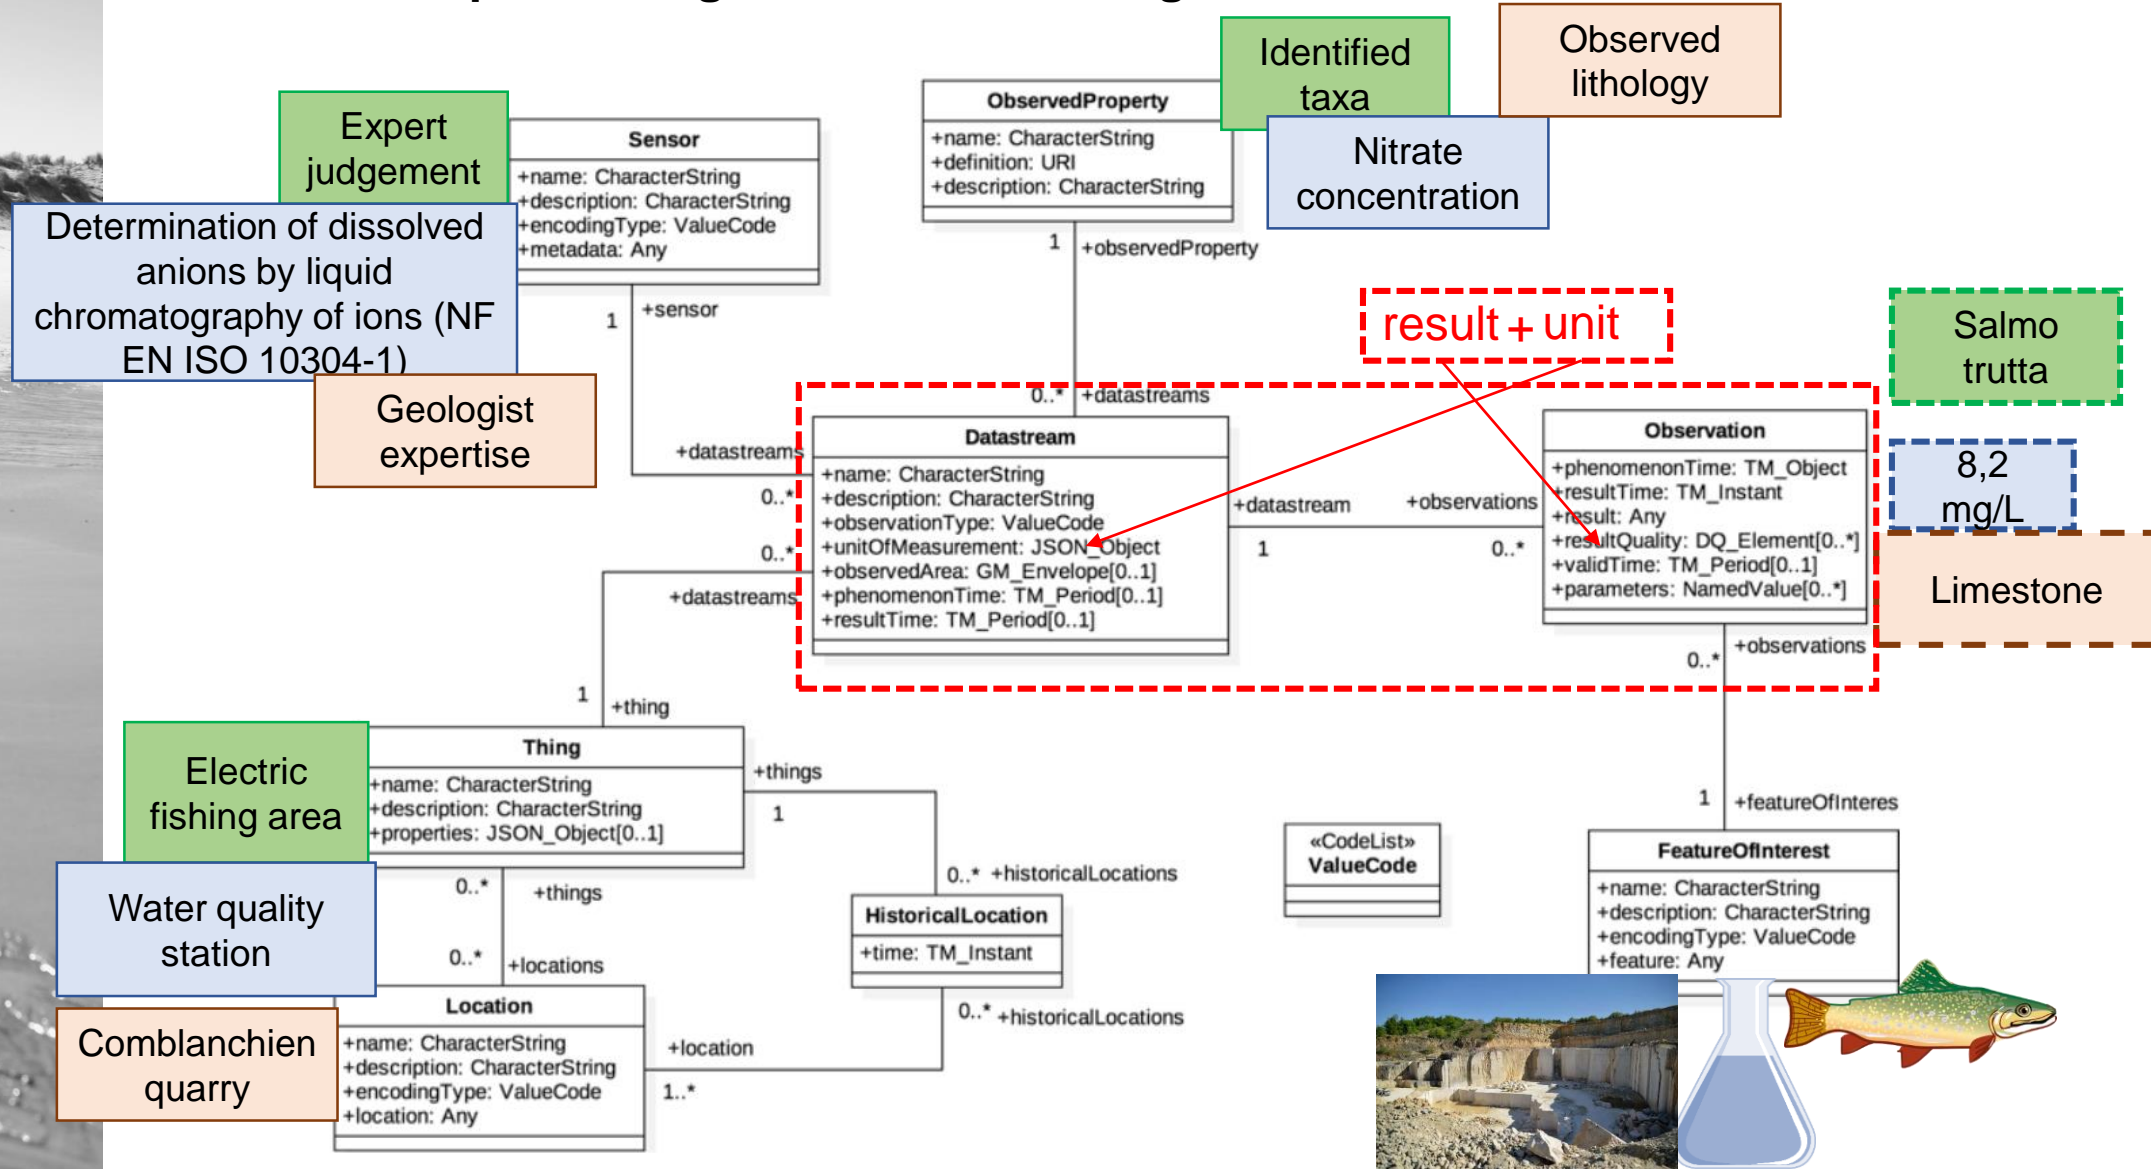

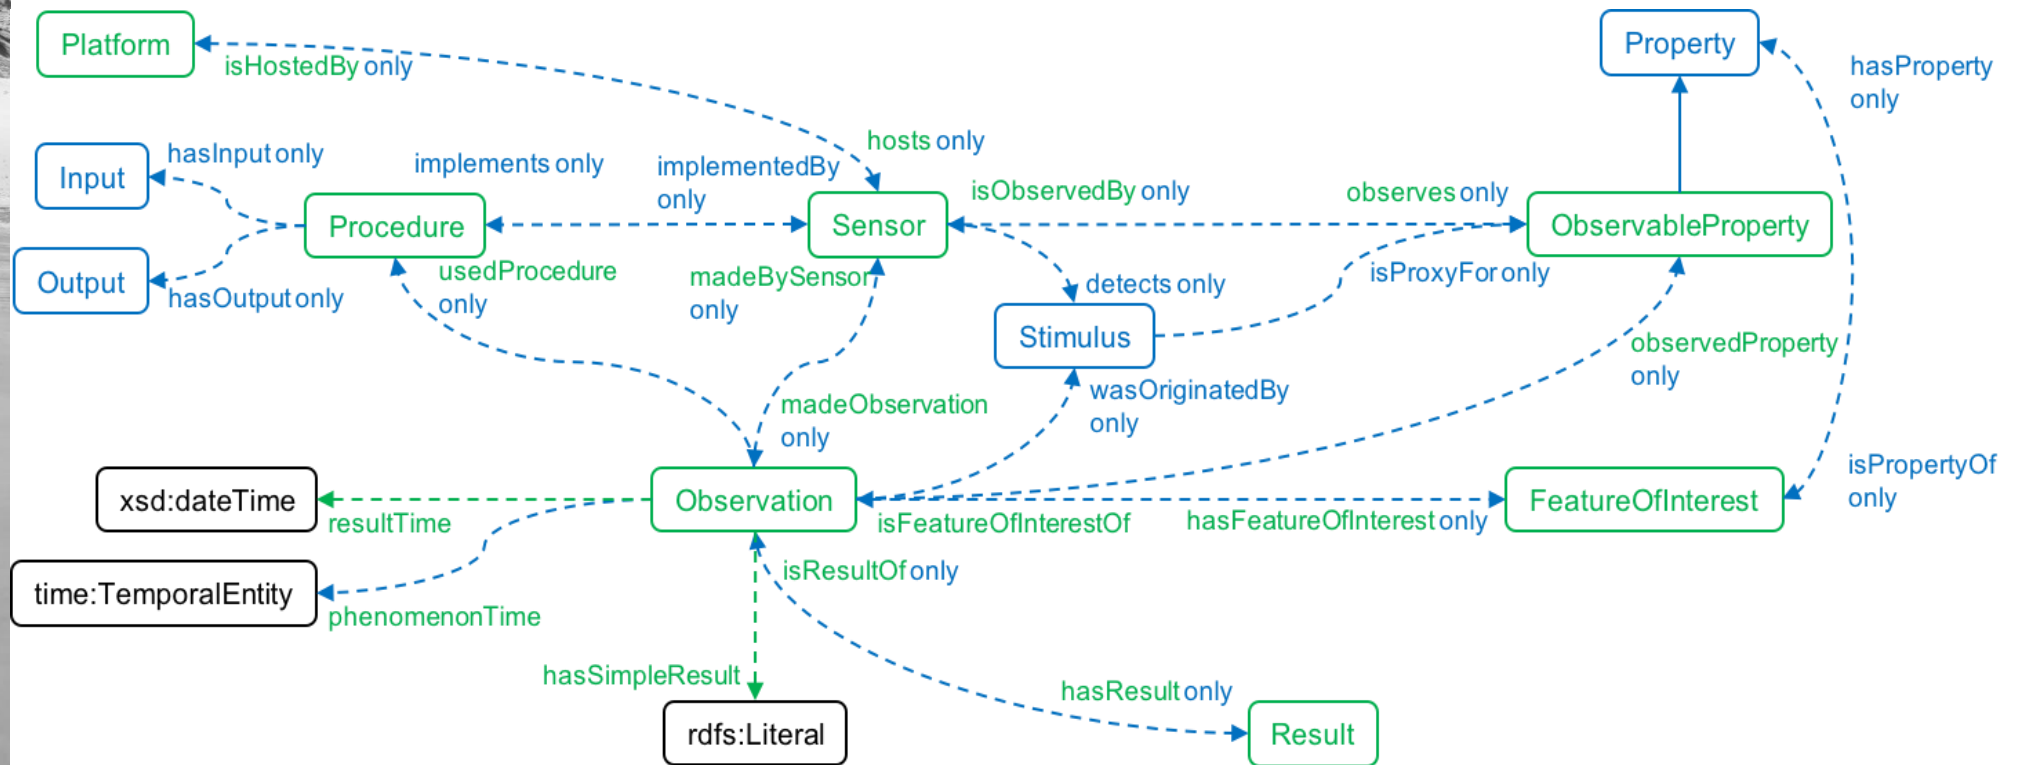

Figure 2: Sensing Entities

Environmental observation use case - overview

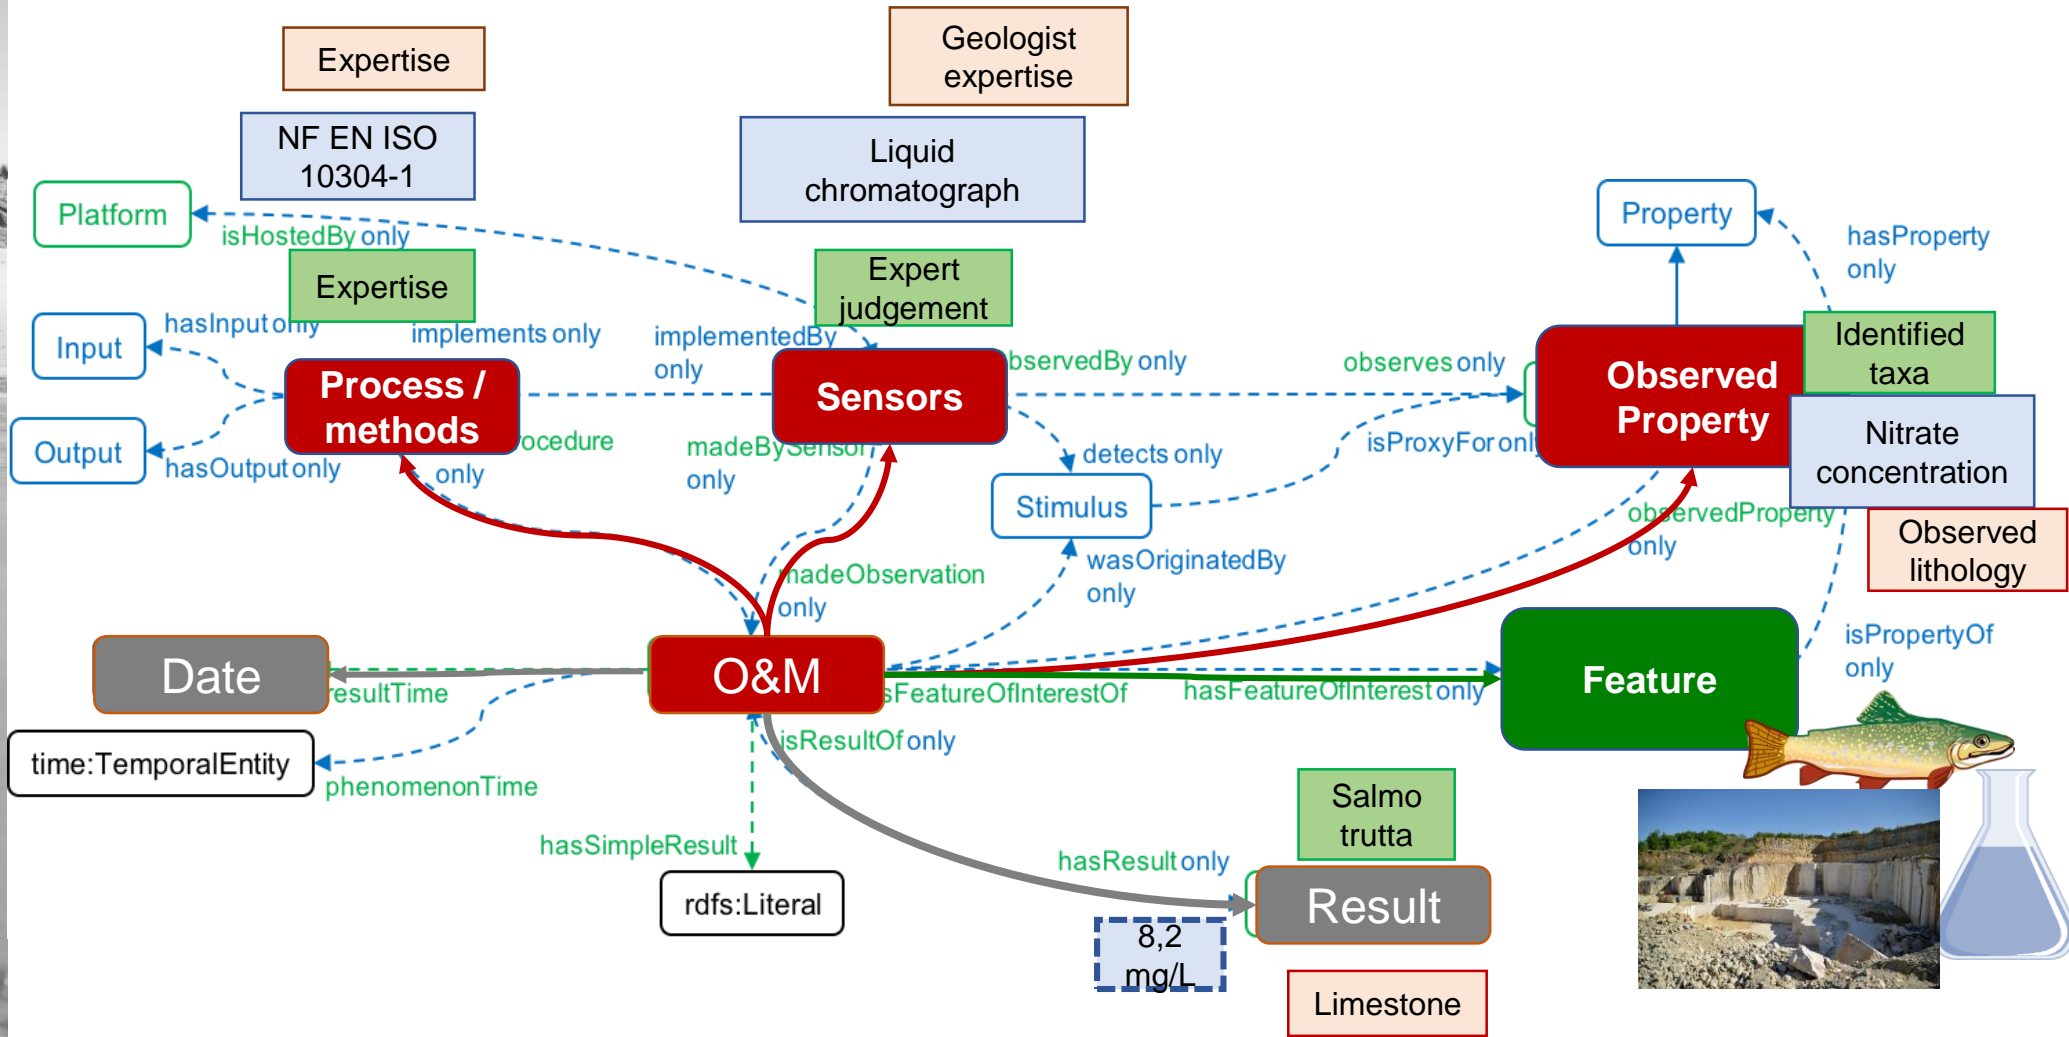

W3C Ontology« inspired from » O&M » : SSN / SOSA

Environmental observation use case - overview

Observation
Observation result
Water Sample (SF_Specimen)
River (ultimate fOI) : HY_Features
Other fOIs on the side (ex : river pertains to river basin) : HY_Features
OMS Observer VS INSPIRE Environmental Monitoring Facility (EF)
OMS Observer / INSPIRE:EF associated information

OMS level 2 example : surface water quality (samples)

Linked Data

- As much as possible : URIs on FeatureInstance (and ?ObservationCollection / Observation?) AND controlled vocabularies (observation method, observed properties, ...)

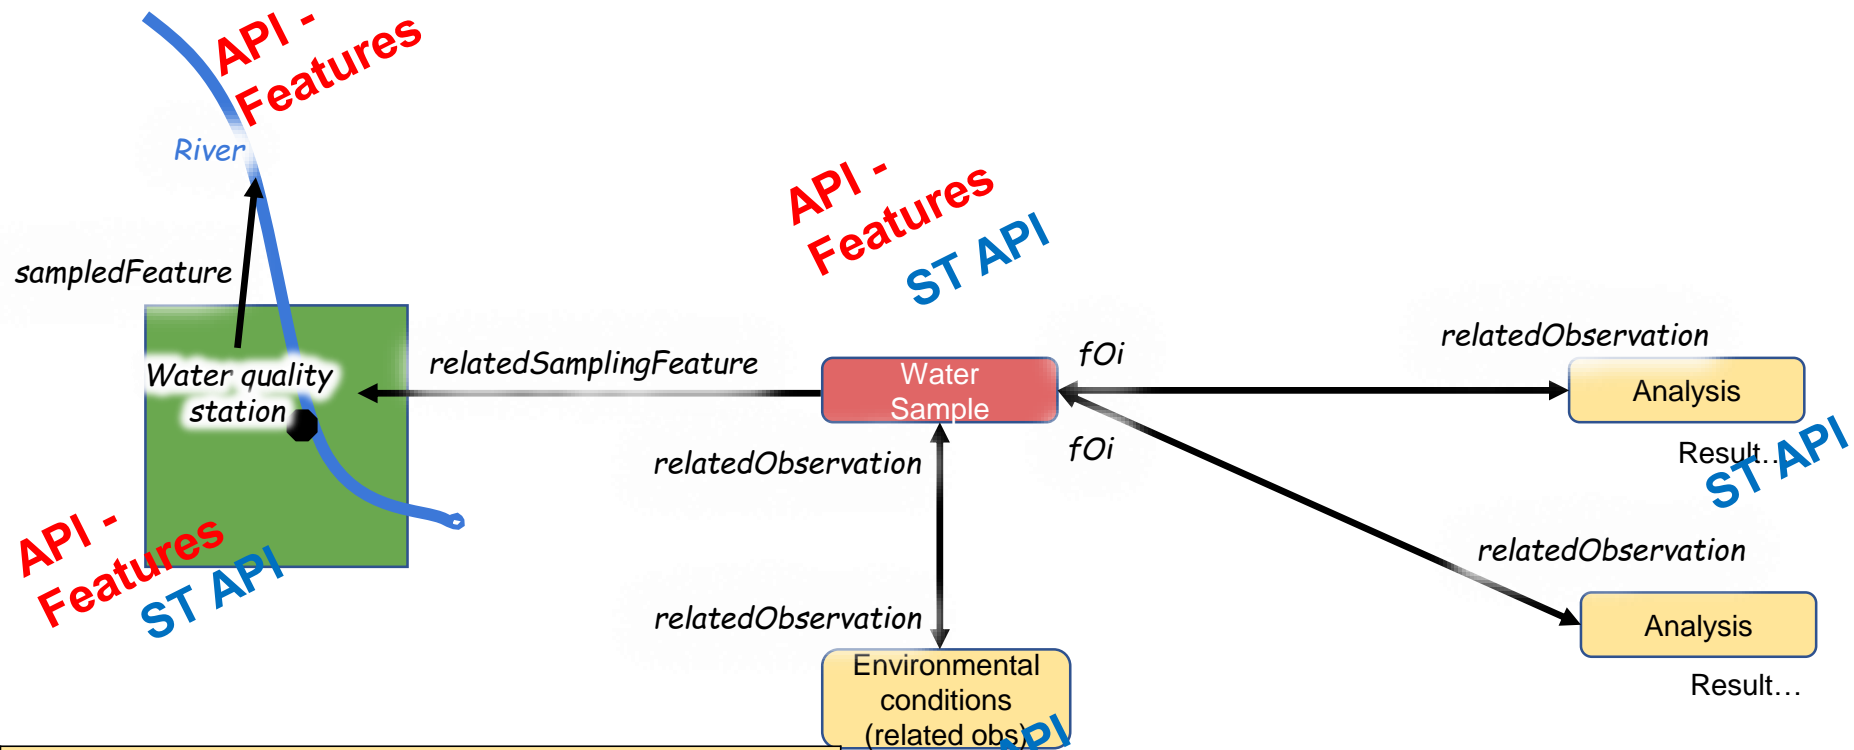

Observation
Observation result
Water Sample (SF_Specimen)
River (ultimate fOI) : HY_Features
Other fOIs on the side (ex : river pertains to river basin) : HY_Features
OMS Observer VS INSPIRE Environmental Monitoring Facility (EF)
OMS Observer / INSPIRE:EF associated information

OMS level 2 example : surface water quality (samples)

OGC APIs

- Simplified (implemented) model => mapped to OGC API + ST API (other not done because of time)

Observation
Observation result
Water Sample (SF_Specimen)
River (ultimate fOI) : HY_Features
Other fOIs on the side (ex : river pertains to river basin) : HY_Features
OMS Observer VS INSPIRE Environmental Monitoring Facility (EF)
OMS Observer / INSPIRE:EF associated information

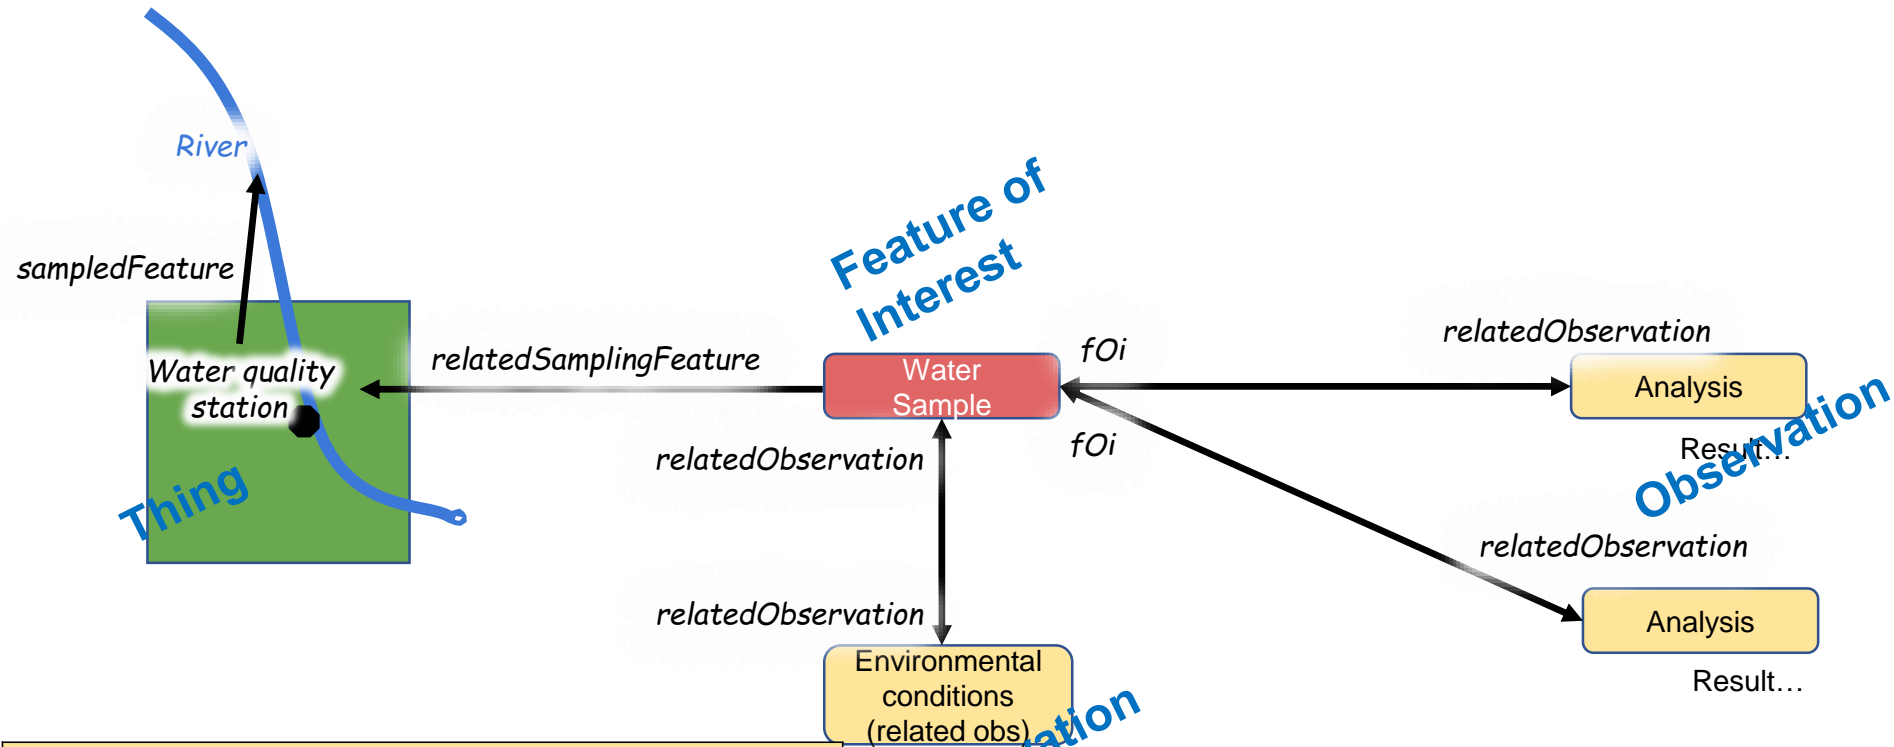

OGC API - Features

OGC SensorThings API

OMS level 2 example : surface water quality (samples)

OGC APIs

- Simplified (implemented) model => mapped to O&M and existing standards then ST API

Observation

OMS Observer VS INSPIRE Environmental Monitoring Facility (EF)
OMS Observer / INSPIRE:EF associated information

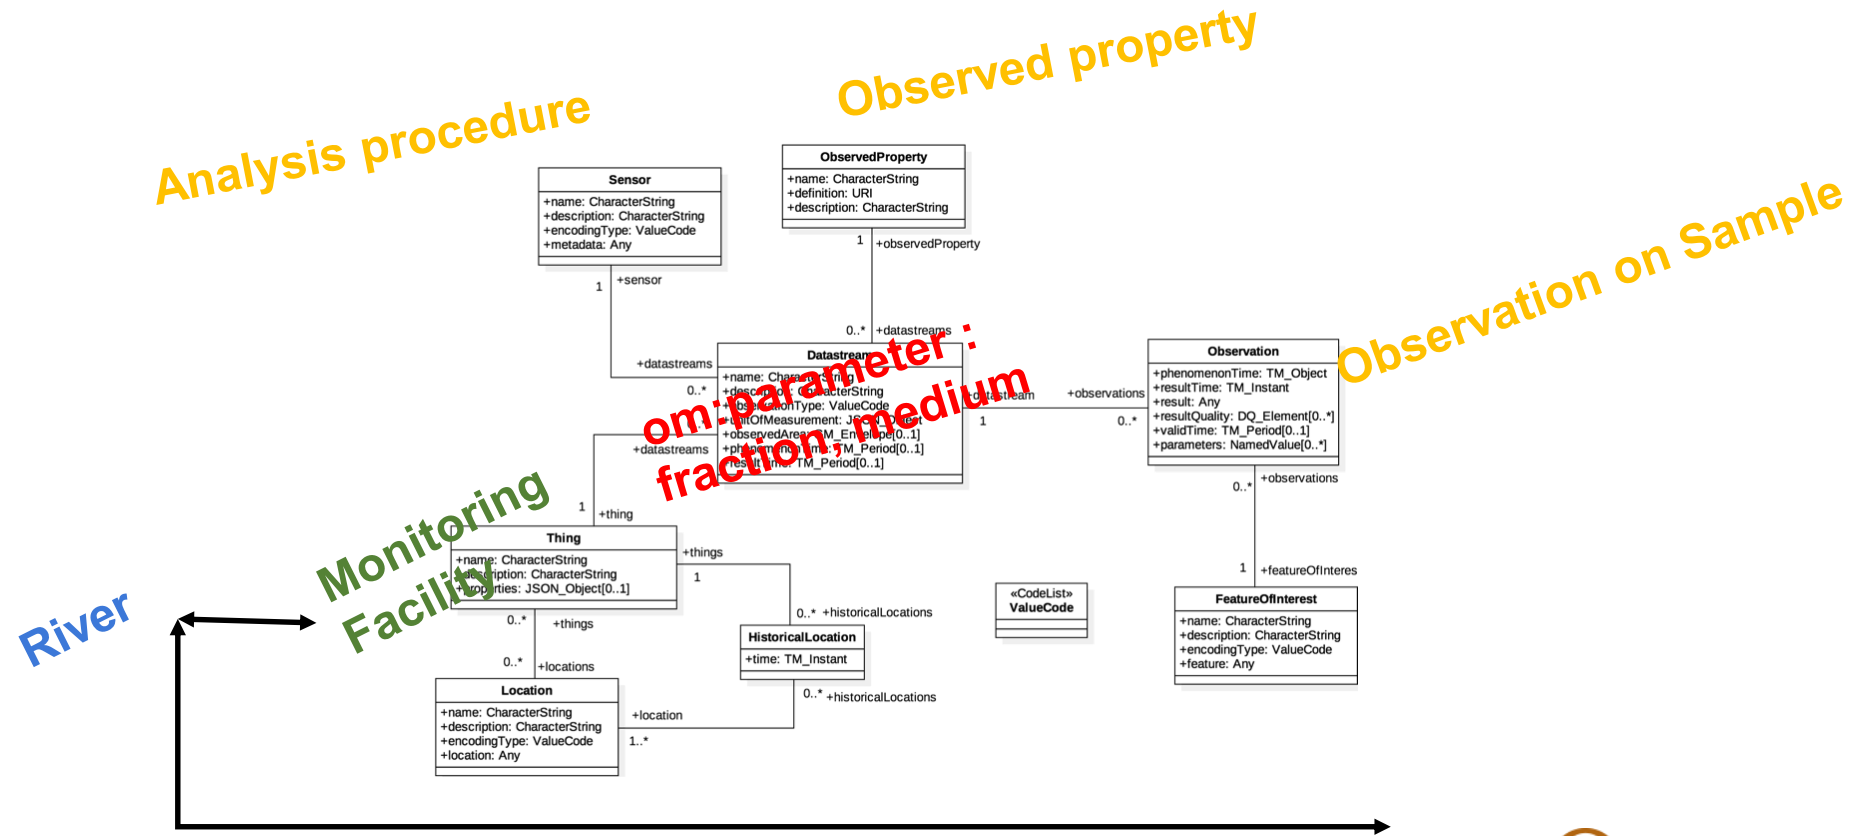

SensorThings
API classes

OMS level 2 example : surface water quality (samples)

OGC APIs

- Chemical concentration - Simplified (implemented) model => mapped to ST API

EPOS : Multi-standards integration in an Enterprise Architect (EA) project

1/ Conceptual Model

Class : Segment

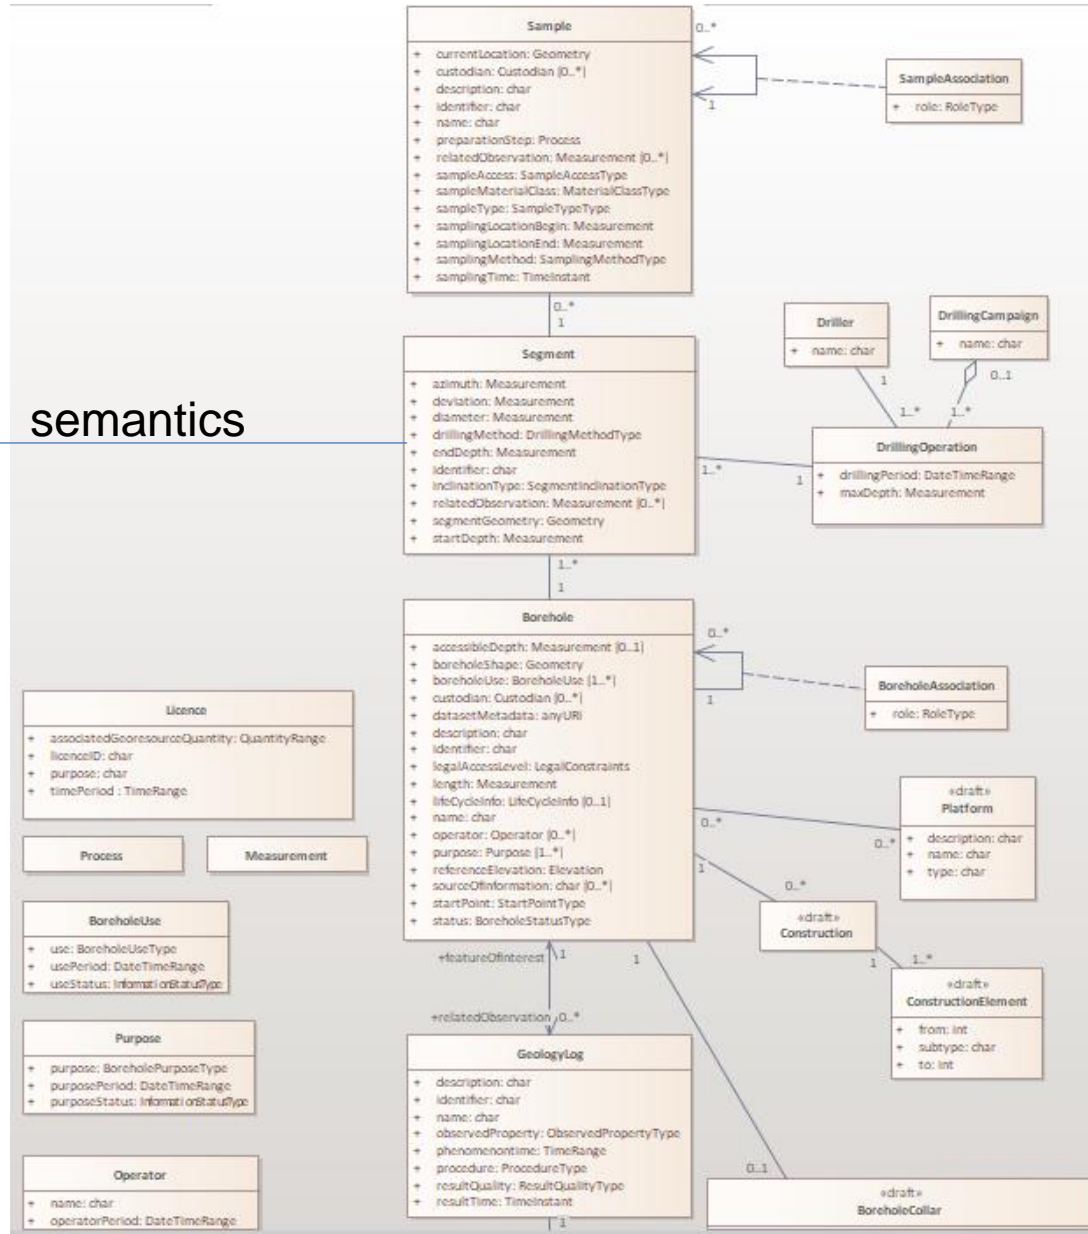

Properties

- General
- Responsibilities
- Requirements
- Constraints
- Scenarios
- Files
- Related Links

Name: Segment

Coherent set of diameter and drillingMethod. Each time one of those two elements changes it's a new segment.

semantics

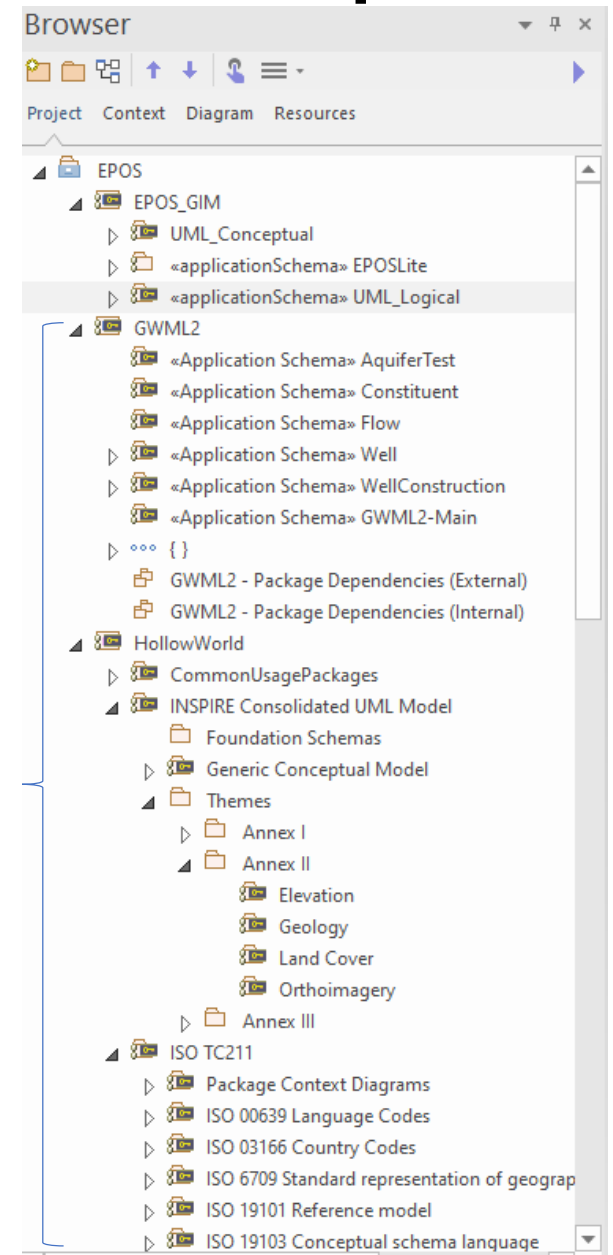

EPOS : Multi-standards integration in an Enterprise Architect (EA) project

2°/ Logical Model built on standards

- Note : This example uses the previous EA-SVN connexion
 - Now we use EA “Reusable Assets”

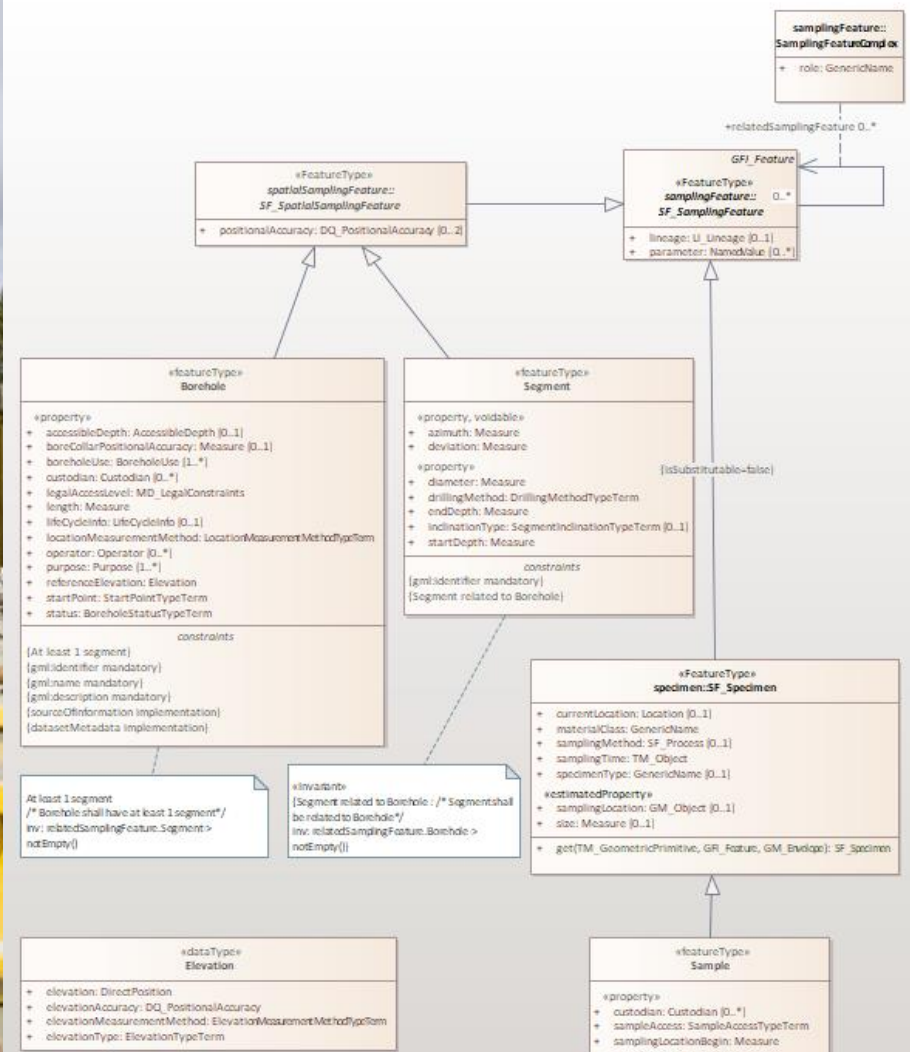

Standards introduced in the « 3_Interoperability_toolbox » presentation

EPOS : Multi-standards integration in an Enterprise Architect (EA) project

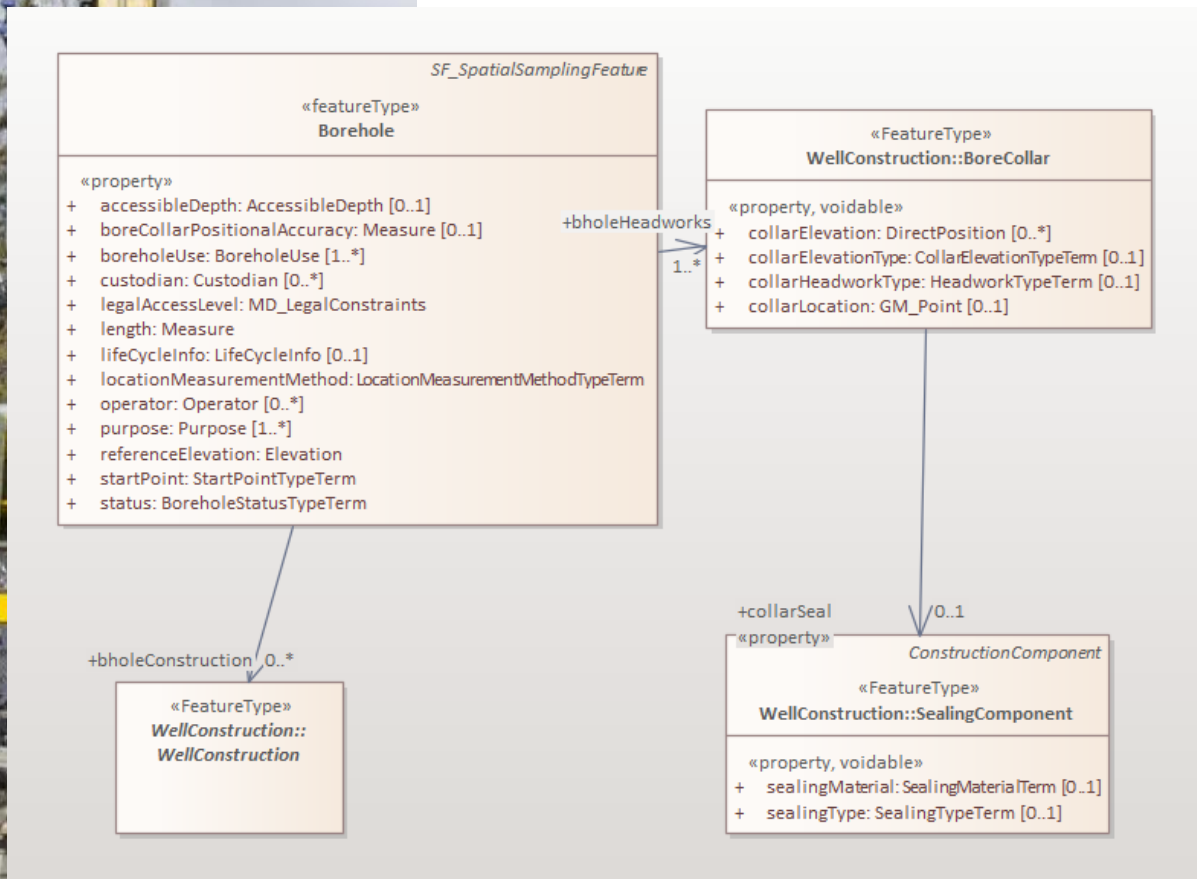

2°/ Logical Model built on standards

In the logical model, the Borehole, Segment, Sample cascade from step 1° is modelled building on classes from Observations & Measurements

EPOS : Multi-standards integration in an Enterprise Architect (EA) project

2°/ Logical Model built on standards

In the logical model, Borehole is a subtype of SF_SpatialSamplingFeature from Observations & Measurements ...

... and Borehole constructions elements from step 1° are reusing classes defined in GroundWaterML2.0

Thank you

Are you too busy to improve?
